

Solution Design Session: Identifying similar historical claims to draw insights from past expert reports

Last updated by | Mennell, Jacob | 19 May 2026 at 10:56 BST

Objective

This session aims to problem-solve and align on solution architecture for the Expert Appointment solution, leveraging existing capabilities within Augmented Triage.

Expected Outcomes

- Agreement on proposed architecture and integration approach
- Alignment on key design principles and trade-offs
- Identification of risks, dependencies, and open questions
- Clear next steps toward implementation

Business Context & Problem Statement

Scope Breakdown

The problem statement is divided into two key parts:

Historical Claims Repository for Expert Appointment Solution (Foundation Layer).

- Build a centralized repository of claims data
- Enable similarity search and historical reuse for Expert Appointment

Search Engine Integration in Augmented Triage (Value Layer)

- Enable extraction of variables to support search
- Semantic search capability within the existing triage workflow

Part 1: Historical Claims Repository

Solution Approach (Optimized)

- Leverage existing Augmented Triage repository
- Implement historical repository changes as a separate package/module within the same repo

Data:

Claims under scope :

- Closed claims by line of business
- Time horizon : TBD

Proposed Architecture

Historical Claims Repository for Expert Appointment

What This Enables

- Centralized repository of all historical claims for Similarity Search:

Guiding Design Principles

These principles drive the architecture decisions:

Reuse Existing Capabilities

- Leverage current ingestion pipelines and workflows
- Avoid duplication of systems

Seamless Integration

- No separate CI/CD pipelines
- Align with existing deployment processes

Unified Data Strategy

- Use existing databases and storage systems

Part 2: Intelligent Search & Extraction Layer

Proposed Integration Architecture

Claims Augmented Triage

Integration with Existing Ecosystem

- Integrate semantic search capability within the existing Augmented Triage architecture
- Implement search and retrieval logic as part of the main worker/service
- Avoid introducing separate services unless required for scale

Next steps:

- Finalise and align search approach : Proposal is to design and test hybrid approach: So that semantic + lexical + domain signals complement each other
